

NEW EXPANDED NEWBORN SCREENING STUDY

The GUARDIAN study is a new study that uses genome sequencing to screen for more conditions than those currently included in standard newborn screening.*

This study is open to babies born at New York Presbyterian Hospitals. You will receive a copy of your baby's test results, and no new sample is needed.

You can learn more about the study before you have your baby and sign up to be invited by visiting our website or calling or emailing our study team:

*Newborn Screening is a standard screening test completed on all babies by the New York State Department of Health. A small sample of blood is collected from the heel and screened for approximately 50 conditions. It is free and routine for every newborn.
